

Amazon Sales Dashboard — Excel Project Report

1. Project Overview

The Amazon Sales Dashboard is an Excel-based data analytics project developed to analyze e-commerce sales performance across multiple business dimensions.

The dashboard provides a consolidated view of revenue, customers, orders, average order value, return rate, cancellation rate, shipping cost, product performance, category performance, payment methods, order status, and geographical sales.

The primary objective of the project was to transform raw sales data into an interactive and visually understandable dashboard that can help identify important sales patterns and business trends.

2. Objectives

The main objectives of the project were:

- Analyze overall sales performance.
 - Track total revenue and order volume.
 - Understand monthly sales trends.
 - Identify the highest- and lowest-performing product categories.
 - Identify top-performing products.
 - Analyze sales across different countries.
 - Understand customer payment preferences.
 - Analyze order status distribution.
 - Monitor return and cancellation rates.
 - Analyze shipping costs.
 - Present key business metrics through a single dashboard.
-

3. Tools and Technologies

Primary Tool:

- Microsoft Excel

Excel Skills Used:

- Data Cleaning
- Data Transformation
- Excel Formulas
- PivotTables
- PivotCharts
- Aggregation and KPI calculations
- Data Visualization
- Dashboard Design

4. Key Performance Indicators

The dashboard currently displays the following major KPIs:

KPI	Value
Total Revenue	394,024,877.21
Total Customers	27,484
Total Orders	39,966
Average Order Value	985.90*
Return Rate	3%
Cancellation Rate	3%
Shipping Cost	295,580.05

Important validation note: The displayed AOV should be verified before publishing the dashboard. If AOV is calculated as $\text{Total Revenue} \div \text{Total Orders}$, the displayed revenue and order count produce approximately **9,859**, not **985.90**. The exact AOV definition may differ if your dataset uses another calculation, but this KPI needs to be checked.

5. Dashboard Analysis

5.1 Monthly Sales Performance

The dashboard compares monthly sales for 2023 and 2024.

The corrected chronological presentation from January through December makes it easier to compare the two years and identify periods of stronger or weaker sales performance.

From the displayed data, **May 2024 shows the strongest monthly sales performance**, while February is comparatively weaker.

This comparison can help identify potential seasonal patterns and periods that may require further investigation.

5.2 Category Performance

The dashboard analyzes sales across six major categories:

- Electronics
- Books
- Toys & Games

- Home & Kitchen
- Sports & Outdoors
- Clothing

Electronics is the highest-performing category by sales, while Clothing records the lowest sales among the categories shown.

This indicates that Electronics is currently the strongest revenue-generating category and may deserve greater attention regarding inventory, promotions, and product expansion.

However, revenue alone does not establish profitability. Profit and margin data would be required to determine whether the highest-sales category is also the most profitable.

5.3 Payment Method Analysis

The dashboard analyzes sales across:

- Amazon Pay
- Cash on Delivery
- Credit Card
- Debit Card
- Net Banking
- UPI

Credit Card appears to be the leading payment method by sales, followed by Debit Card and UPI.

This information can help understand customer payment preferences and can be useful when designing payment-related promotions or improving the checkout experience.

5.4 Product Performance

The dashboard presents the **Top 10 Products by Sales**.

Among the products displayed, **Dress Shirt** is the leading product by sales.

The remaining top-performing products include SmartPhone Case, Memory Card 128GB, Phone Tripod, Action Camera, Cookware Set, Puzzle 1000pc, SmartLight Bulb, Noise Cancelling..., and LED Desk Lamp.

Further analysis could be performed by comparing these products using units sold, order count, growth rate, and profit margin.

5.5 Order Status Analysis

The dashboard analyzes five order statuses:

- Delivered
- Shipped

- Pending
- Returned
- Cancelled

Delivered orders represent the overwhelming majority of orders, while cancelled and returned orders form relatively small portions.

The dashboard reports both a **3% return rate** and a **3% cancellation rate**.

These metrics should continue to be monitored because even relatively small percentages can represent a significant number of orders when overall order volume is high.

5.6 Country-wise Sales Analysis

The dashboard compares sales across:

- United States
- India
- United Kingdom
- Canada
- Australia

The **United States is clearly the dominant market**, contributing substantially more sales than the other countries shown.

India is the next significant market, while the United Kingdom, Canada, and Australia contribute considerably smaller sales volumes.

This indicates a strong geographical concentration of sales in the U.S. market.

5.7 Shipping Cost

The dashboard reports total shipping cost of **295,580.05**.

Including shipping cost is useful because revenue alone does not provide a complete picture of operational performance.

A stronger future version of the dashboard should also calculate:

Shipping Cost % of Revenue

and potentially analyze shipping cost by:

- Country
- Category
- Product
- Order
- Month

This would help identify areas where logistics costs are relatively high.

6. Business Recommendations

Based on the available analysis, the following actions could be considered:

1. Focus on high-performing categories

Electronics should be analyzed further to identify the products and subcategories responsible for its strong performance.

2. Investigate the U.S. market

Since the U.S. contributes the majority of sales, the business should monitor customer retention, growth, and operational performance in this market.

3. Investigate monthly seasonality

The differences between strong and weak months should be examined to determine whether promotions, holidays, product launches, or seasonal demand explain the variation.

4. Monitor returns and cancellations

Although both rates are currently 3%, the underlying reasons should be analyzed by product, category, country, and month.

5. Optimize shipping costs

Shipping costs should be analyzed relative to revenue and order value to identify opportunities for logistics optimization.

7. Final Assessment

The Amazon Sales Dashboard provides a solid overview of e-commerce sales performance and demonstrates practical Excel skills in data analysis, visualization, KPI development, and dashboard design.

The current version is suitable for showcasing as a **student/aspiring Data Analyst portfolio project**, provided that all KPI calculations—especially Average Order Value—are validated.
